Preserving Traditional Values Through A Modern Perspective Preserving Traditional Values Through A Modern Perspective:

HISTORICAL AND CULTURAL SITES

Group 8 - Product Development

Team Member:

Nguyễn Thị Cẩm Thạch - 220226

Nguyễn Ngọc Anh - 210008

Nguyễn Khánh Ly - 210087

Nguyễn Đình An Hạnh - 210209

I. Summary

The assignment requires students to come up with creative solutions to preserve and promote Vietnamese cultural values. Through attracting the participation of young people. Group 8 focuses on Ho Chi Minh historical sites as the target audience. Through various market and user research, the group focuses on overcoming the problem of fragmented information and lack of interaction during the trip. The solution is to develop a mobile app that integrates Tinder interface, AI Chatbot, and Buddies Matching to synthesize information and increase interaction.

II. Problem Statement

The current experience of exploring historical and cultural sites faces two critical challenges:

1. Scattered Information: Information about these sites is fragmented across various sources; therefore, it is difficult for visitors to find what they need. This lack of centralization can result in customers missing essential details, leading to a less satisfying experience.
2. Lack of Interactivity: During visits, there are no engaging or interactive approaches to enhance the experience. This could be more unappealing to the youth, who often find traditional methods of exploration boring and inspiring.

These challenges lead to the following questions:

- **How might we make the information about historical and cultural sites more centric to the customer?**
- **How might we provide an interactive way to discover historical and cultural sites?**

Addressing these questions is essential to developing solutions that not only centralize relevant information but also offer interactive and engaging experiences. And it creates a meaningful connection between visitors—especially the youth—and the rich history and culture of these sites.

III. Product Strategy

1. Target Customer

The primary target customers for this product are:

- Age: 18–25 years old.
- Location: Based in Ho Chi Minh City, Vietnam.
- Gender: Inclusive of all genders.
- Occupation: University students and young employers.
- Interests: Passionate about history and culture, with a desire to explore and connect with the heritage of Vietnam.

- Characteristics:

  +) Tech-Savvy: Comfortable using modern technology and digital tools.

  +) Trendy: Open to adopting new experiences that align with current trends.

2. Business Goals

The primary goal of this product is to create a social impact by attracting more youth to learn about and visit historical and cultural sites. By modernizing the exploration experience and making it more engaging, the product aims to foster a deeper connection between young people and Vietnam's cultural heritage.

To achieve this, the product involves key stakeholders, including:

- Museum Curators and Guides: Responsible for inputting museum information and stories into the AI Chat system.
- Local Officers: Tasked with managing and updating event details, policies, and ticket prices through the app.
- Site Administrators: Monitoring visitor activities and buddy connections to improve on-site experiences.

Given that most state-certified historical sites belong to the government, the long-term goal is to transfer the product to state management. After achieving approximately 12,000 active young users within the first year, the product will be handed over to the government for continued sponsorship and operation, ensuring its sustainability and scalability. This partnership ensures that the product remains a public asset that benefits both local authorities and the community.

3. Optimal Technology

To enhance user engagement and address the challenges of scattered information and lack of interactivity, the product leverages the following innovative technologies:

- **Site Matching**

  The product incorporates a Tinder-style interface to make the experience of discovering historical and cultural sites more fun and interactive. Users can swipe to explore sites that match their preferences, turning the selection process into a more personalized and enjoyable activity.

- **AI Chatbot**

  An AI-powered chatbot is integrated into the app to provide users with immediate and personalized responses to their questions. Whether they seek historical details, event schedules, or travel tips, the chatbot ensures a seamless and informative interaction, catering to individual needs.

- **Buddies Matching**

  The app includes a buddy-matching feature, allowing users to find companions who share similar interests or plan to visit the same sites. This feature encourages social interaction and enhances the overall experience, making it more appealing for young people who prefer group activities.

By integrating these advanced technologies, the product transforms traditional site exploration into a modern, engaging, and socially interactive experience.

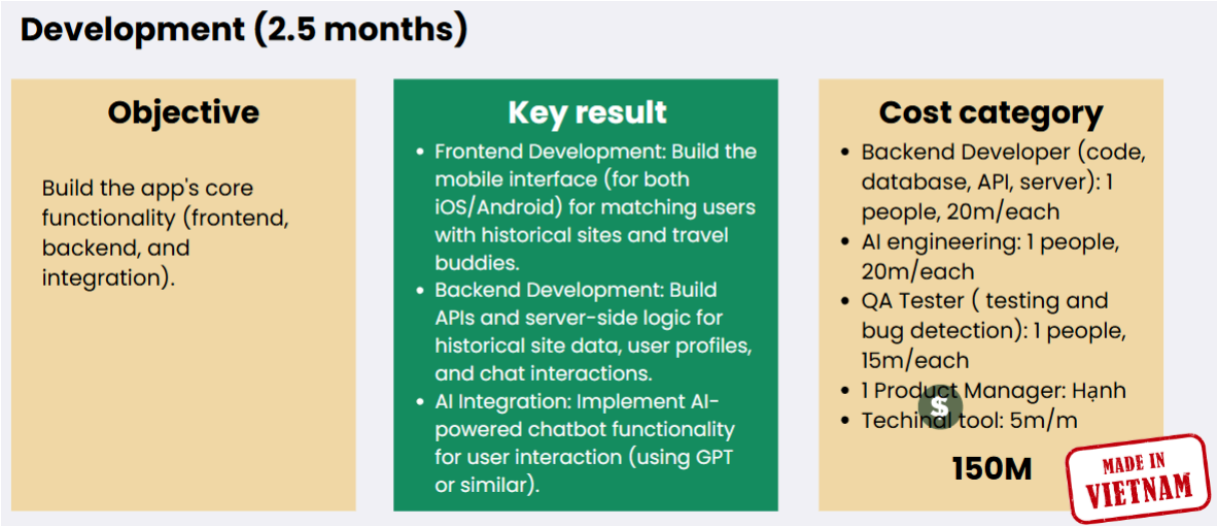
4. UX Strategy

Design a product prototype in Figma with UX and UI functions. The link is HERE.

- Vision: "To make finding and interaction seamless and engaging for young tourists visiting historical sites through innovative digital solutions."
- Goal:

Success Metrics	KPI (first 3 months)	KPI (next 6 months)
Number of App Download	1000	10000
Ticket bought on the app	30 (3% conversion rate)	1000 (10% conversion rate)
Length of user sessions	Log in: 2 min Matching: 3 min AI Chat box: 5 min (standard) Buddies Matching: 5 min	Log in: 2 min Matching: 3 min AI Chat box: 5 min (standard) Buddies Matching: 5 min
Retention Rate	% of users go back to matching and chatting with AI: 40% % of user go back to matching buddies: 30% % of user buy the ticket second time: 20%	% of users go back to matching and chatting with AI: 80% % of user go back to matching buddies: 50% % of user buy the ticket second time: 40%
Revenue	Ticket commission: ~ 0.5M Ad per click: ~ 2M Buddies Matching: ~1.5M (3% from ticket buyer)	Ticket commission: ~ 5M Ad per click: ~ 20M Buddies Matching: ~45M (10% from ticket buyer)

- Plan:



Alpha Testing (1 month)

Objective

Initial internal release with limited features to get feedback from a small user group.

Key result

- Internal testing of the app's functionality, AI integration, and user experience.
- Fix bugs, improve AI responses, and tweak travel buddy matching logic.

Cost category

- Backend Developer (database, API, server): 1 people, 20m/each
- AI engineering: 1 people, 20m/each
- QA Tester (testing and bug detection): 1 people, 15m/each
- 1 Product Manager: Cẩm Thạch
- Techinal tool: 5m/m

$ 60M

MADE IN VIETNAM

Closed-Beta Testing (0.5 month)

Objective

Release a more stable version to a larger audience for external testing

Key result

- Release beta version to a selected user group.
- Gather feedback, improve AI and user experience, and refine the app.
- Prepare for app store submission and marketing campaigns

Cost category

- Backend Developer (database, API, server): 1 people, 20m/each
- QA Tester (testing and bug detection): 1 people, 15m/each
- AI engineering: 1 people, 20m/each
- 1 Product Manager: Ngọc Anh
- Techinal tool: 5m/m

$ 30M

MADE IN VIETNAM

Launch & Maintenance (2 months)

Objective

Keep the app running smoothly, improve user experience, and update features.

Key result

- Mobile App Developer (for ongoing updates and improvements)
- Backend Developer (for ongoing server-side maintenance)
- QA Tester (to ensure quality with each update)
- Customer Support Specialist (to assist users)
- Marketing Specialist (to continue app promotions)

Cost category

- Backend Developer (database, API, server): 1 people, 20m/each
- AI engineering: 1 people, 20m/each
- QA Tester (testing and bug detection): 1 people, 15m/each
- Product Manager: Cẩm Thạch
- Customer Support Specialist (to assist users): Khánh Ly, Ngọc Anh
- Marketing Specialist (to do app promotions): Hạnh
- Technical Tool: 5m/month

$ 120M

Total: 360M

5. Success Metrics

Key performance indicators (KPIs) for the product include:

- App downloads and user retention rates.
- Engagement levels are measured by feature usage (e.g. chatbots, buddies matching).
- Revenue generation through subscriptions, ticket commissions, and advertisements.
- User satisfaction scores and feedback to assess experience quality.
- Number of tickets bought through the app
- The length of usage in each phase of the app, including log-in, site matching, AI chatbox, and buddies matching.

III. Design Process

1. Market Research

a. Market overview

i. Current state:

- Many historical sites in Saigon are having trouble attracting tourists, especially the youth. Despite many interventions in upgrading investment, adding technology, and 50% discounts on tickets for students, etc., these sites are only crowded during major holidays like Tet.

ii. Challenges:

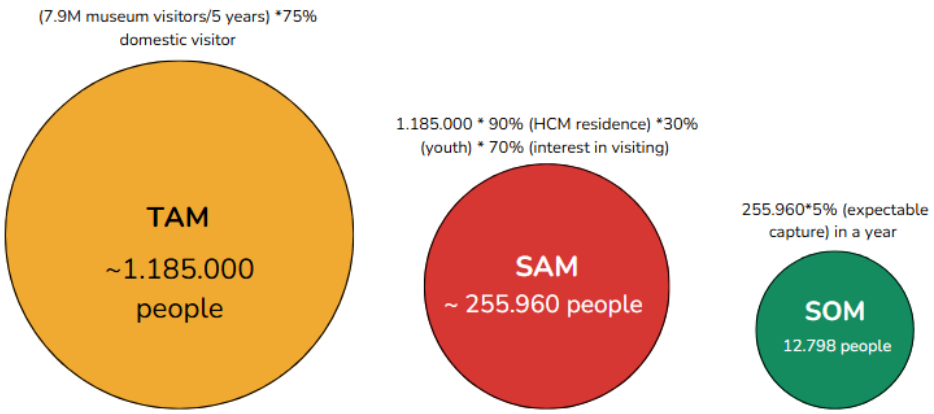
- Outdated presentation method: go and see, limited use of digital technology, lack of activities, guides, or stories reduces interest.
- Young people perceive historical sites as "boring."
- Information about sites is fragmented and not updated regularly.

iii. Opportunities

- Young people are very interested and receptive to history; however, they need more engaging and age-appropriate methods.
- Many historical sites incorporate new technologies, such as VR, or organize various thematic sessions but are not widely known.
- The government provides support for visitors, such as discounts for students and the elderly or free entrance tickets on some special occasions.

b. Market Sizing

The figure below shows estimates of potential market sizes:



Detail explanation:

- In the past five years, 7.9 million museum visitors have visited HCMC, with 75% being domestic. Thus, the estimated total addressable market for HCMC museum tourism is approximately 1.185.000 people.

- 90% of these visitors reside in Ho Chi Minh City. 30% of the target audience consists of youth (primary audience). 70% of these youth are interested in visiting historical places. Therefore, the estimated serviceable addressable market of travel booking companies is about 1,185,000×0.9×0.3×0.7=255,960 people.

- We expect to capture 5% of the SAM in a year, which is a reasonable estimate for a new market entrant. Thus, the estimated serviceable obtainable market is about 12.789 people.

b. Competitor Analysis

i. Product information

This link provides a clearer view.

		Google Maps (Direct competitor)	Traveloka (Indirect competitor)	Saigon Tourist Travel (Substitutional competitor)
Information of competitors	Founded year	2005	2012	1975
	Year entering VN	2010	2015	
	User traffic	1 billion monthly active users world wide	21.18 million visits	> 923.000 visitors
	Revenue	$11 billion	$100M - $200M	7.770 billion VND

Product/Service	Target customer	- Travelers, local residents, and businesses seeking location-based services. - Users looking for navigation assistance and local business information.	- Travelers looking for comprehensive travel solutions including flights, hotels, and activities. - Users interested in booking local experiences and tours.	- Tourists seeking guided experiences, particularly those interested in cultural and historical tours. - Groups or individuals preferring travel arrangements.
	Platform	Available on web browsers and mobile applications (iOS and Android).	Available on web browsers and mobile applications (iOS and Android).	Primarily operates through physical offices but also has an online presence for bookings via their website.
	Common features	- Navigation: Provides directions and real-time traffic updates. - User reviews and ratings: Offers insights from other users about locations. - Street view: Allows virtual exploration of locations. - Business listings: Displays essential information like hours of operation and contact details.	- Booking capabilities: Allows users to book flights, hotels, and activities in one platform. - User reviews: Provides customer feedback on accommodations and experiences. - Promotions and discounts: Regularly offers deals to attract budget-conscious travelers.	- Guided tours: Provides expert-led tours to historical sites with in-depth narratives. - Package deals: Offers bundled services that include transportation, meals, and entry fees.
	Uncommon features	Local 3-Pack Visibility: Helps businesses appear prominently in local search results, enhancing visibility.	Local experiences focus: Offers unique local tours that may include historical sites, tailored to cultural experiences.	Ability to create personalized travel plans based on customer preferences

ii. SWOT Analysis

		Google Maps **(Direct competitor)**	**Traveloka** **(Indirect competitor)**	**Saigon Tourist Travel** **(Substitutional competitor)**
SWOT Analysis	Strengths	- Provides location-based information on historical landmarks and attractions. - Provide user reviews. - Provides detailed historical information. - Contains general area information.	- Provides location-based information on historical landmarks and attractions. - Provide user reviews. - Provides detailed historical information. - Contains general area information.	- Provide a lot of information for users. - Tickets are included in the tour price. - Natural and close expression.
	Weakness	- Unable to respond to personalized user questions. - Unable to purchase tickets online. - Unable to update information about new events happening at that location.	- Unable to respond to personalized user questions. - Unable to purchase tickets online. - Unable to update information about new events happening at that location.	- Only for large, famous monuments, and many tourists visit. - Usually not suitable for locals who like to experience things on their own. - Must follow the guide's instructions and time. - Usually, a tour has to go with many people and strangers, so it is not suitable for groups of friends or families who want to go alone.
	Opportunities	Growth in digital marketing.	Expanding functionalities and partnership with tourist attractions.	Ability to collaboration with government organization
	Threats	Customer assumption: People often know GG Maps as a tool to search direction rather than finding information.	Competition from other platform having the same function.	Customer changing behaviors (young people prefer yolo traveling style)

c. User Research

- We broke the questions down based on the user's journey while visiting historical sites and surveyed 57 participants regarding their agreement or disagreement with various statements related to their experience. Subsequently, we conducted in-depth interviews with 11 participants to gain a deeper understanding of their experiences.
- A paradox emerges: **70% of young people express interest in learning about and visiting historical sites, yet only 7.7% actually choose to visit these sites for leisure.** Why are they interested but rarely go? Through the survey, we identified two key pain points that could explain this paradox:

  +) Scattered information: Many young people may feel overwhelmed or frustrated when trying to find comprehensive, centralized, or easily accessible information about historical sites. This makes it difficult for them to plan visits effectively or understand the significance of these sites without investing significant time and effort. As a result, they may be less motivated to go, despite their initial interest.

  +) Lack of interactive activities at the historical sites: Young people often seek more engaging and interactive experiences. If historical sites rely primarily on passive activities like reading plaques or looking at static displays, they may not provide the type of dynamic or immersive experience that younger audiences find appealing. The absence of interactive features (e.g., VR experiences, hands-on exhibits, gamified tours) might make these sites seem less attractive compared to other, more interactive entertainment options.
- The following sections will provide an in-depth analysis of the survey and interview data.

i. Survey

To determine if the survey sample aligns with the target customers established in the Product Strategy, a demographic analysis is performed:

- We received 57 responses in total; the number of females (40) dominates the survey with 70%, followed by 28% males (16) and 2% of other genders (1).
- All of our participations are based in Ho Chi Minh City.
- Ages: Generation Z 18-22 (70%) and Generation Y 23-30 (28%).
- Occupations: 65% are students, and 30% are employed.

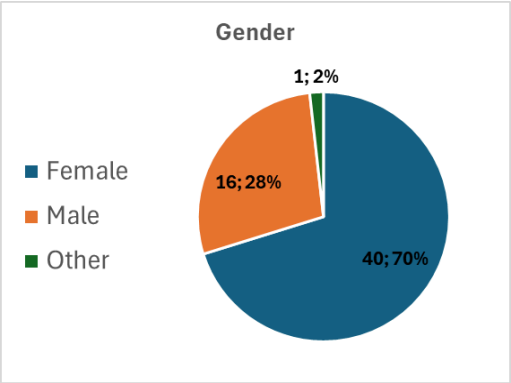


Figure 1. Gender shares.

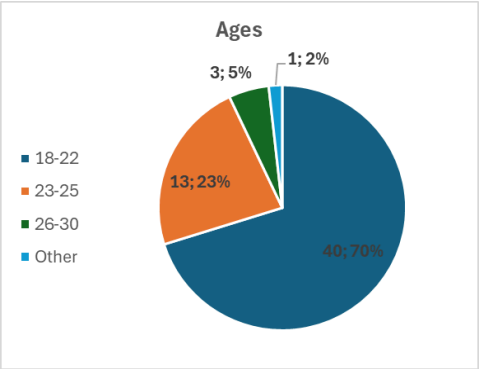

Figure 2. Age shares.

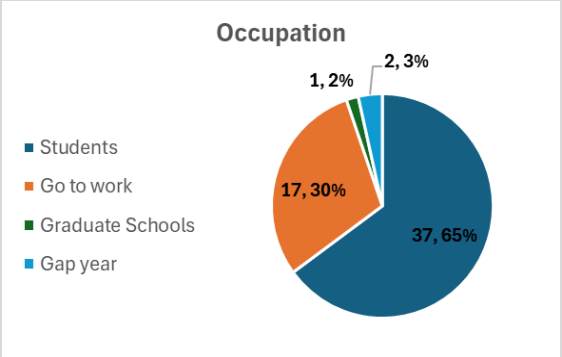

Figure 3. Occupation shares.

The survey indicates that visiting cafes and socializing at friends' houses are the two most preferred outing locations for young individuals.

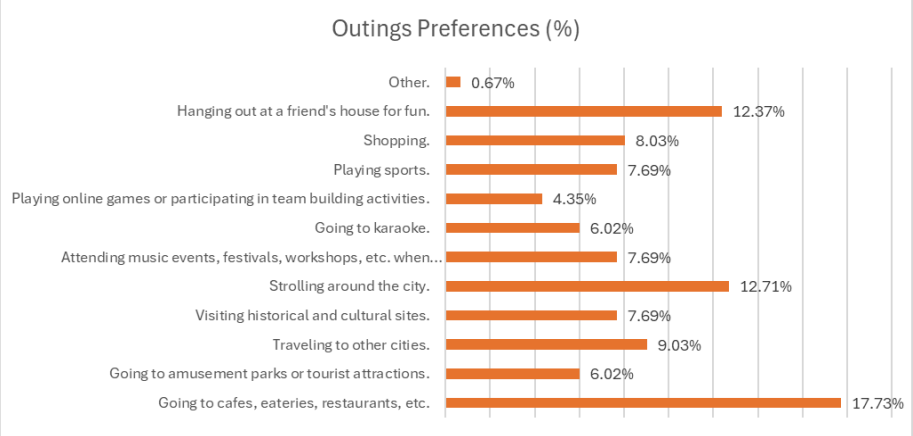

Figure 4. Outings Preferences (%)

Next, our team identified the prevalent challenges users face during their experiences and their tendency when visiting historical sites

- Tendency:

- 66.7% of users discover content at historical sites on their own without the travel guide.
- 70.2% of users are interested in visiting historical sites.
- 66.7% of users are interested in learning about historical sites.

- Existing problems:
  - 80.8% of users feel there is a lack of interactive activities when visiting historical sites other than just looking at displays.
  - 80.7% of users know nothing about the themes and activities organized at historical sites.
  - 78.9% of users have difficulty finding up-to-date information about events and activities at historical sites.
  - 75.5% of users find information about historical sites scattered and not centralized.
  - 64.8% of users think historical sites are not clearly organized.

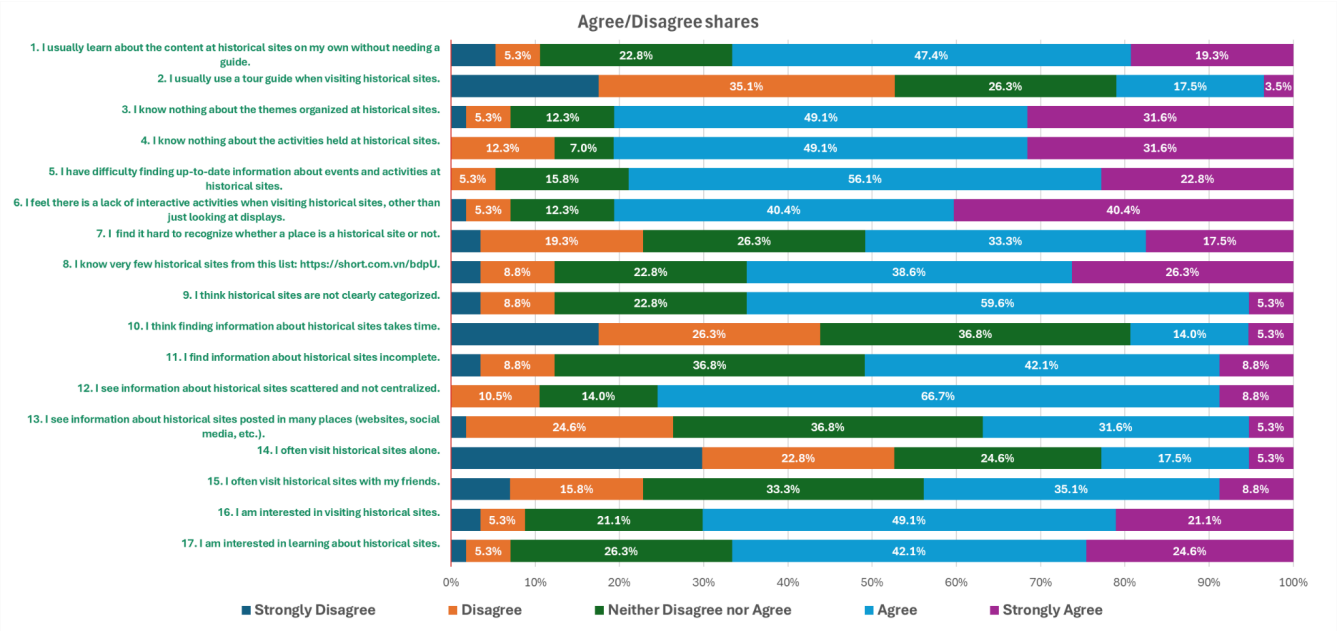

Figure 5. Agree/Disagree shares.

ii. In-depth interviews

After the survey, our team invited participants to join a follow-up interview session. We conducted formal interviews with 11 users and asked them to describe their full journey when visiting historical sites.

- Among the 11 users, 10 shared that they **typically visit historical sites with friends or family and prefer not to go alone.**

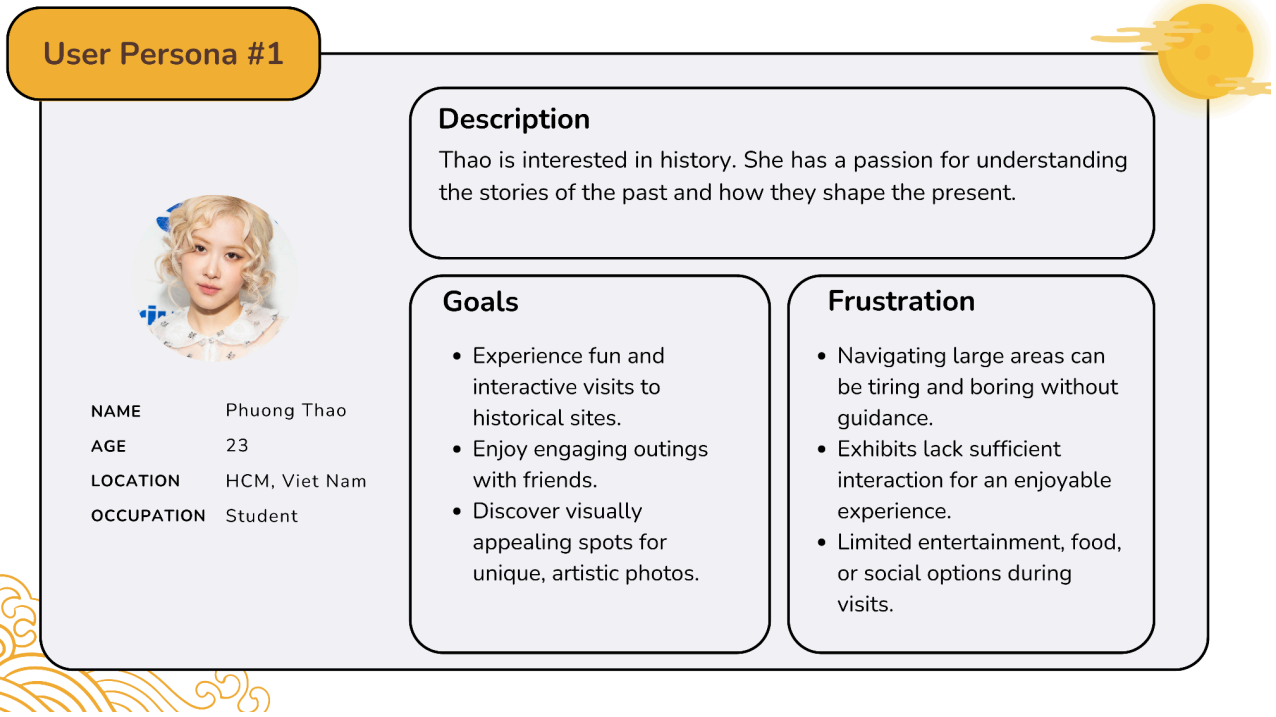
- They **would only visit alone** if there was a **specific task or exercise to do.**

- The main reason for this preference is that they enjoy having a companion to share the experience with. At historical sites, instead of just reading a wall of text, having someone with them allows for the exchange of opinions and knowledge, making the trip more meaningful. People enjoy learning new things and immediately sharing those discoveries with others, rather than keeping the experience to themselves.

	NEED	EXPLORE	DECISION MAKING	PURCHASE	VISIT
User Actions (Activities)	Plan/brainstorm ideas where to go, with who and how	Search information about potential places and their information (open hour, entrance fee, review, notice,...)	Decide on where to go	Buy a ticket (online/offline)	Experience the place
Touchpoints (Interaction Points)	Google search, social media, magazines	Google Map, Facebook events, TikTok, websites	Self making decision or directly communicate with travel-buddy if they have	Websites, on site place	The place itself
Emotions (Mood Meter)	DELIGHTED				
	NEUTRAL				
	FRUSTRATED				
Opportunities	Improve users awareness by sending them suggestions	Develop a personalized suggestion tool to reduce overwhelm	Add feature to gather specific information about the place was choosen	Add feature to buy a ticket online	Add option to find a travel-buddy who has the same interest

Figure 6. Users journey

iii. Customer personas



User Persona #2

NAME	Phuong Tuan
AGE	24
LOCATION	HCM, Viet Nam
OCCUPATION	Office Worker

Description

Tuan is an enthusiastic traveler with a curious mindset. He is open to learning about historical sites, even though they don't particularly captivate him. He often visits these places alone since his friends generally lack interest in history.

Goals

- Explore new places whenever having an opportunity.
- Enjoy an overall entertaining experience that feels worth his time.

Frustration

- Historical sites often need more interactive and fun elements, making visits feel unengaging.
- He doesn't see reasons to revisit since the experience doesn't change or offer anything new.

d. Technology Research

i. Technology Examples and Best Practices

Global:

- The British Museum: Uses a combination of virtual tours, online collections, and interactive exhibits, powered by a robust CMS and user-friendly website design.
- The Louvre Museum: Employs AR technology to enhance the visitor experience, allowing users to interact with artworks and learn more about their history.
- The National Museum of Singapore: Utilizes interactive displays, digital storytelling, and immersive installations to create engaging experiences.
- The Smithsonian National Museum of Natural History: Offers virtual tours, 3D models of artifacts, and online educational resources, demonstrating the potential of digital technologies to enhance access to cultural heritage.

Vietnam:

- War Remnants Museum: Effectively uses multimedia displays, documentaries, and interactive exhibits to educate visitors about the Vietnam War.
- Cu Chi Tunnels: Offers AR experiences that allow visitors to visualize the tunnel system and learn about its history, showcasing the potential of AR in historical sites.

- Imperial Citadel of Thang Long: Uses digital projections and interactive maps to recreate the citadel's history, demonstrating the power of visual storytelling.
- My Son Sanctuary: Employs 3D models and virtual reconstructions to showcase the ancient Cham civilization, highlighting the potential of digital preservation and reconstruction.

ii. Technology dependency

Our app's success is intrinsically linked to technology. We have a breakdown of the crucial dependencies for easily navigated and managed.

- AI-Powered Chatbot: The chatbot is envisioned as a core element, providing users with immediate and personalized information. This necessitates a sophisticated Natural Language Processing (NLP) engine. This engine must be capable of:

  +) Understanding diverse user queries: From simple questions like "What are the opening hours of the War Remnants Museum?" to more complex historical inquiries.

  +) Providing accurate and relevant responses: This requires access to a comprehensive and regularly updated knowledge base of historical information.

  +) Learning and improving over time: Machine learning (ML) algorithms can be employed to analyze user interactions and refine the chatbot's responses, making it more accurate and helpful over time.

- Site and Buddy Matching: These features rely heavily on robust algorithms and efficient data processing.

  +) Site Matching: This requires analyzing user preferences (e.g., historical periods, types of sites) and matching them with relevant site attributes. This could involve collaborative filtering techniques (similar to how music streaming services recommend songs) or content-based filtering based on site descriptions and user interests.

  +) Buddy Matching: This involves identifying users with compatible interests and travel plans. Algorithms could consider factors like preferred historical periods, social interaction styles, and availability.

- Ticket Purchasing and Stamp Collection:

+) Secure Payment Gateway Integration: The app needs to integrate with a reliable and secure payment gateway (e.g., Stripe, PayPal) to process ticket purchases.

+) Stamp Generation and Storage: A system for generating unique digital stamps and storing them securely within user accounts is required.

- Social Features:

  +) "Story-like" Event Display: Implementing an Instagram Story-like feature for displaying events requires dynamic content loading and potentially caching mechanisms for smooth performance.

  +) Trip Review System: This requires a database to store reviews and ratings, along with features for users to provide feedback and upload images.

- App Functionality and User Experience: The app's overall success hinges on a seamless and engaging user experience. This requires:

  +) Intuitive User Interface (UI): A well-designed interface is crucial for simple navigation and interaction. This includes clear menus, visually appealing layouts, and responsive design that adapts to different screen sizes.

  +) Smooth User Experience (UX): The app must be fast, reliable, and simple to use. This involves optimizing performance, minimizing loading times, and providing helpful prompts and guidance to users.

- Content Management: The app's value proposition depends on providing accurate and up-to-date information about historical sites. This requires a robust content management system (CMS) that allows for:

  +) Efficient Data Entry and Updates: Museum curators, local officers, and site administrators need an easy way to input and update information about sites, events, and other relevant details.

  +) Data Integrity and Accuracy: The CMS should ensure data quality and consistency with mechanisms for verifying information and preventing errors. consistency

  +) Multimedia Integration: The CMS should support various content formats, including text, images, videos, and audio files, to provide a rich and engaging user experience.

iii. Technologies integrated

- Artificial Intelligence (AI):

  +) Natural Language Processing (NLP): Dialogflow, Rasa, or other NLP platforms can be used to build the AI chatbot.

  +) Machine Learning (ML): TensorFlow, PyTorch, or scikit-learn can be used for personalized recommendations, improving chatbot responses, and optimizing matching algorithms.

- Mobile App Development:

  +) Cross-Platform Frameworks: React Native or Flutter can be used to develop the app for both iOS and Android platforms efficiently.

  +) UI/UX Design Tools: Figma, Adobe XD, or Sketch can be used to design the user interface.

- Database Management:

  +) Cloud Databases: Firebase, AWS DynamoDB, or Google Cloud Firestore offer scalability and flexibility.

  +) Relational Databases: PostgreSQL or MySQL can be used for structured data storage.

- Third-Party Integration: Evaluate the incorporation of payment systems such as Momo or VNPay, which necessitates payment for their APIs.

- Gamification and User Engagement:

  +) Tinder-like Swiping Mechanism: Implementing a familiar and engaging interface like Tinder's swiping can make exploring historical sites feel more interactive and personalized. This approach can foster a sense of connection by:

  +) Humanizing the Sites: Presenting sites with visually appealing images and concise descriptions, encouraging users to "like" or "dislike" them, creates a sense of personality and encourages interaction.

- E-commerce and Payment Processing:

  +) Payment Gateway APIs: Integrate with APIs from Stripe, PayPal, or other payment providers.

  +) Security Protocols: Implement robust security measures (e.g., encryption, tokenization) to protect user payment information.

- Social Features and Content Delivery:

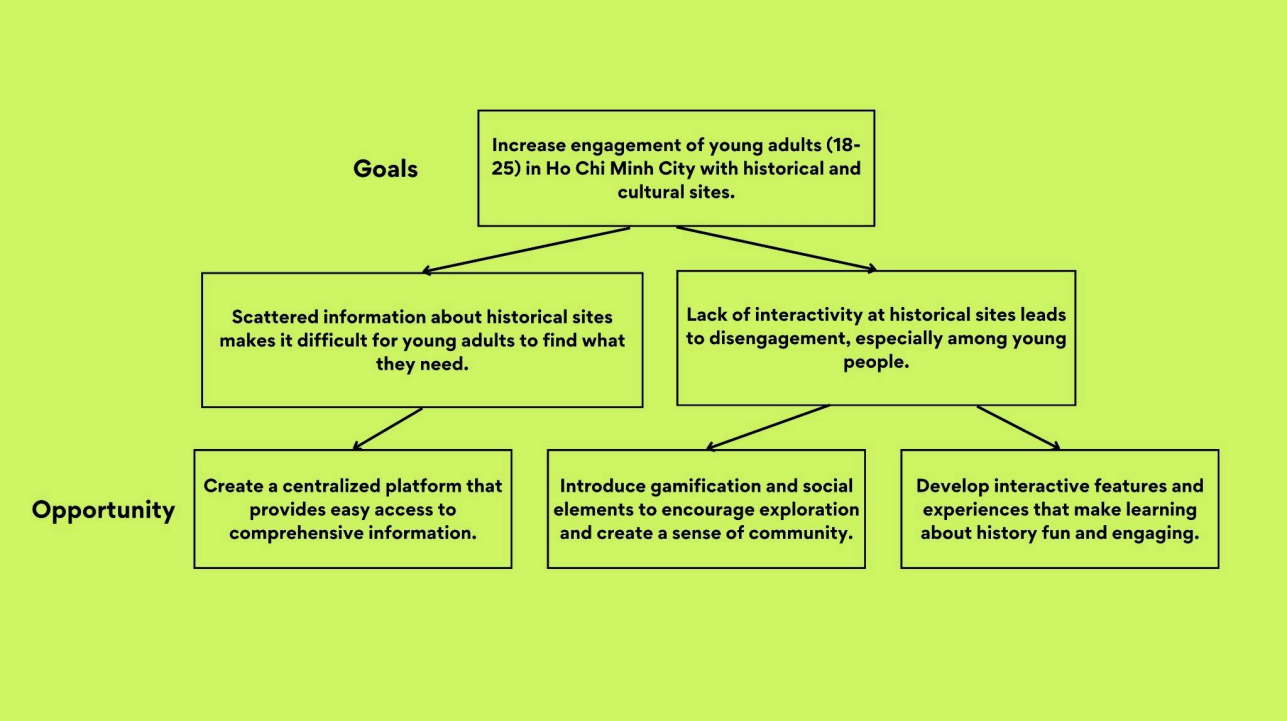
+) Real-time Databases: Consider using real-time databases (e.g., Firebase Realtime Database) for dynamic content updates like event displays.

+) Content Delivery Networks (CDNs): Use CDNs to optimize image and video delivery for the "Story-like" event feature and trip reviews.

2. Product Design

a. Thoughtful Execution Tree

- Assumption 1: Young adults in Ho Chi Minh City have access to smartphones and are comfortable using mobile apps.
- Assumption 2: There is sufficient interest in history and culture among the target audience.
- Assumption 3: Museums and historical sites will be willing to collaborate and provide information for the app.
- Assumption 4: The government will be recept



Opportunity

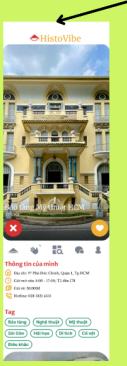
Create a centralized platform that provides easy access to comprehensive information.

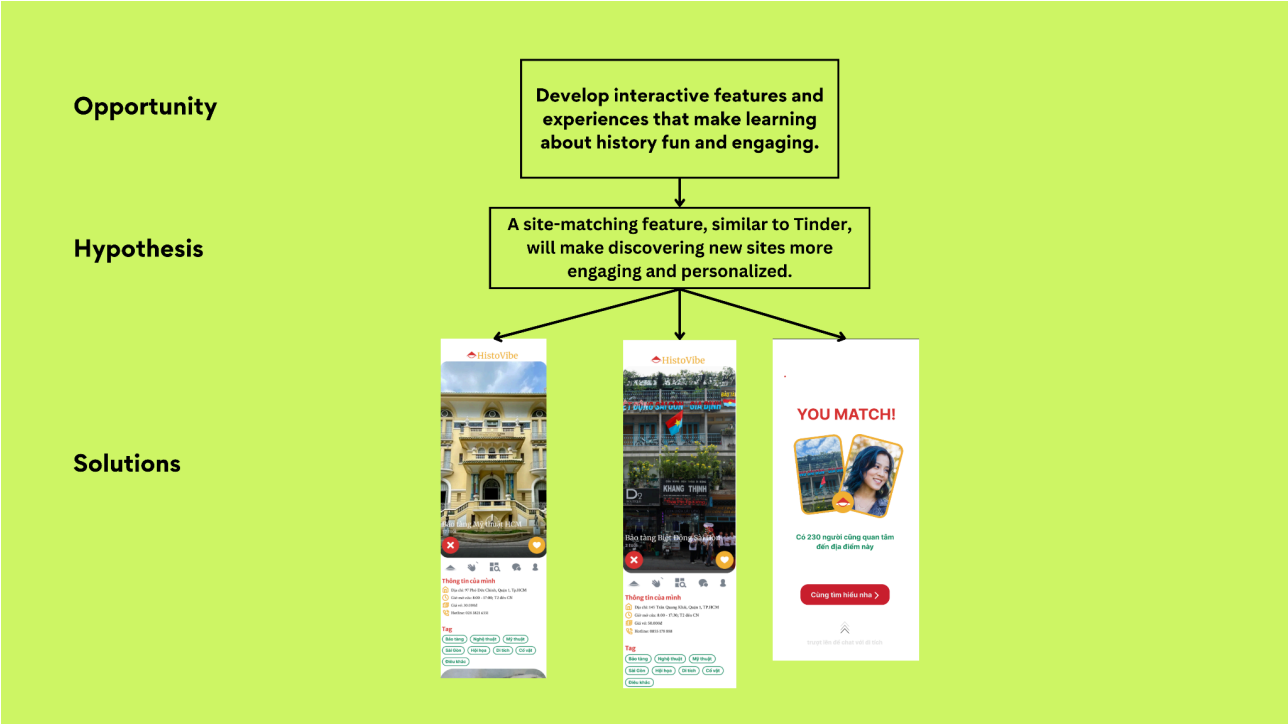
Hypothesis

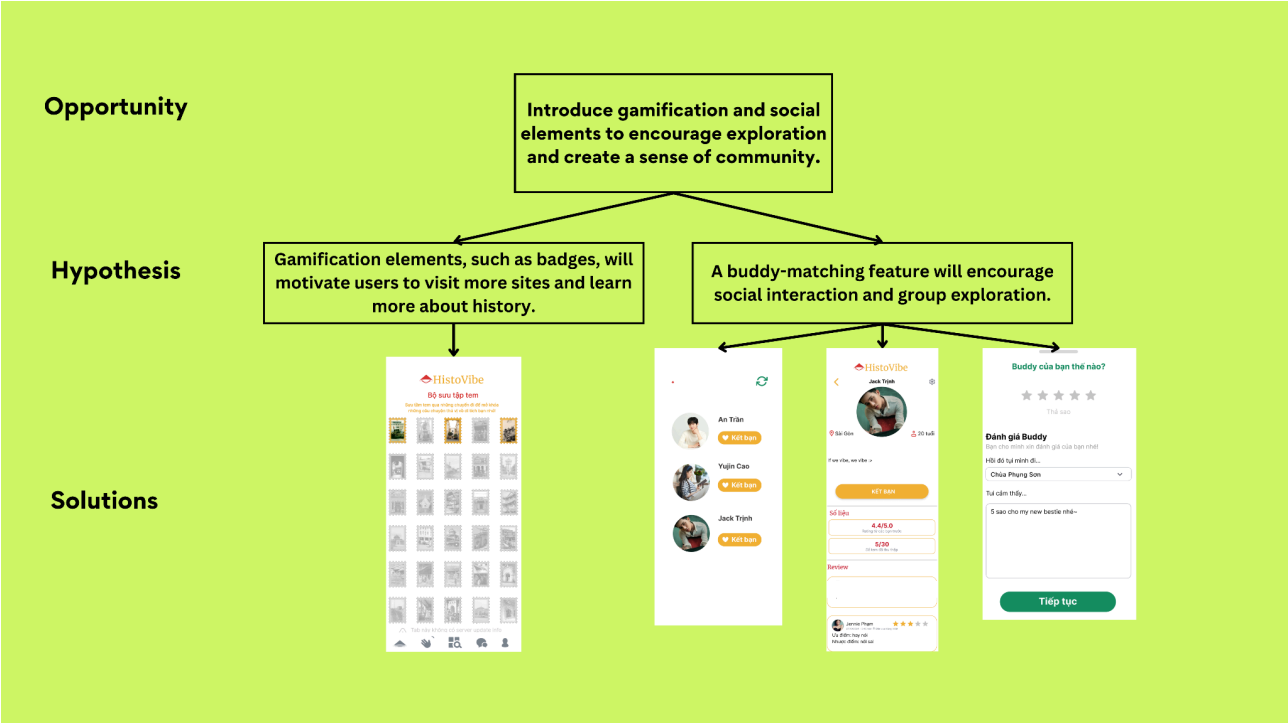
An AI-powered chatbot that can answer questions about history and culture will enhance the learning experience.

Tinder interface that makes information easy to display

Solutions







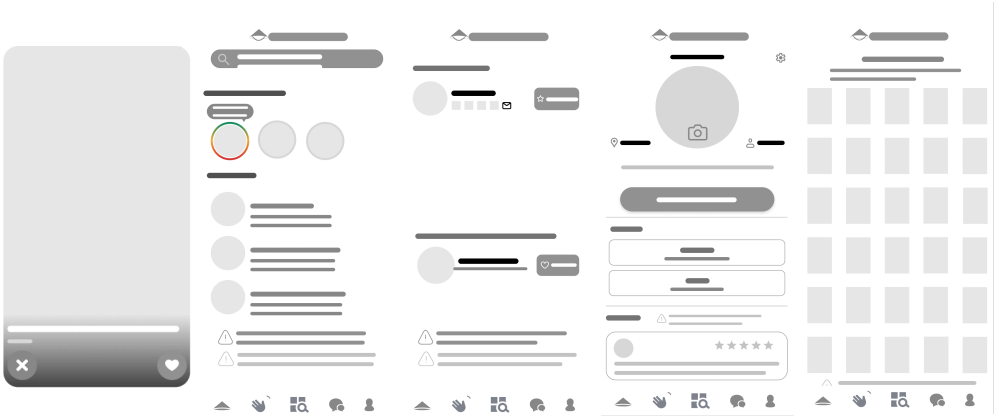
b. Feature Management

Feature Category	Feature Name	Priority	Dependencies	Release Phase	Notes
Core	Site Database	High	-	1 (MVP)	Comprehensive, searchable, detailed info, images, maps

	AI Chatbot	High	Site Database, NLP	1 (MVP)	Answer questions, historical info, site details
	Site Matching	High	User Preferences, Site Database	1 (MVP)	Tinder-style interface, personalized recommendations
	Basic User Account	High	-	1 (MVP)	Profiles, save favorites, track progress
Essential	Buy Ticket	High	Payment Gateway, Site Database	2	Secure payment processing, ticket generation
	Stamp Collection	High	Ticket Purchase, User Account	2	Earn stamps for ticket purchases, track progress
Secondary	Buddy Matching	Medium	User Profiles	2	Connect with shared interests, group exploration
	Review Trip with Buddies	Medium	Buddy Matching	2	Rate experiences, share feedback, add photos
	"Story-like" Events	Medium	Site Database, Real-time Updates	3	Display upcoming events on site profile pictures
	Social Sharing	Medium	-	2	Share experiences on social media
Future	Offline Functionality	Low	Site Database	4	Access info without internet

c. Design Scope

i. Wireframing



ii. Visual Design System (Placeholder)

iii. High-fidelity prototype

The link to the high-fidelity prototype is HERE.

b. Validation

i. User feedback from high-fidelity prototype

User Feedback

User's name	"Wow" moment	Willing to install?	Other suggestion
Diễm My (20 tuổi, never used Tinder and Bumble before, CS major)	"Site matching khá thú vị, vì nó không đơn thuần là đưa ra thông tin cho người dùng đọc. Cảm thấy funny vì có matching và xem profile Buddies"	Yes	Nên có hướng dẫn thêm về cách quẹt trái, quẹt phải, scroll down, vì bạn chưa dùng Tinder hay Bumble bao giờ. Nên có nhiều options hơn cho Refresh Buddies, ví dụ bao nhiêu tiền cho số lần refresh thay vì trả theo tháng.
Dương (20 tuổi, đã từng dùng dating app trước đây, His major)	Ý tưởng rất tốt. Thật không ngờ mình phải trả tiền để refresh danh sách buddies.	Maybe	Mình cứ quẹt nhưng mà actually là mình đang được chọn: mình quẹt một phát được match luôn -> tỉ lệ quay lại sử dụng app không cao. Vì bình thường khi dùng dating app, người ta sẽ phải chờ 1 khoảng thời gian nhất định mới được match và sự chờ đợi đó là lý do mà họ quay lại dùng app.
Thảo (21 tuổi, đã dùng dating app, Hà Nội)	Rất okie, thú vị và dễ dùng, thích nhất là tính năng tem, không ngờ phải trả tiền để refresh danh sách buddies. Sẽ dùng nếu có địa điểm ở Hà Nội vì cũng mù mờ chỗ đi chơi.	Yes	Chữ ở chat hơi bé, nên có option tăng cỡ chữ để dễ đọc.
Huy (21 tuổi, chưa dùng dating app, Melbourne)	entertaining, design intuitive & minimalistic, dễ dùng, tính năng tem rất vui.	Yes	registration có nhiều trang quá, nên để để mấy cái tên với date of birth với địa chỉ ở cùng 1 trang đỡ navigate nhiều. Bỏ mấy cái rating đi, không nên rating người dùng. thích thêm feature viết blog. có group chat để đi chơi không đi hai người.

ii. Potential Improvement

- Start implementing and evaluating user results on the app.
- Create a separate environment for messaging with Buddies instead of relying on other messaging platforms
- Update all historical sites for Saigon
- Work with travel companies to design their own support
